YHS

The Young Hydrologic Society (YHS) is a bottom-up initiative to stimulate the interaction and participation of young hydrologists within the hydrological community.

Founded in October 2012, the YHS is currently run by a team of PhD's and post-doc's from several universities across the world.

What is DataViz?

“DataViz” = Data Visualization

graphical representation of scientific data

“InfViz” = Information Visualization

graphical representation of scientific concepts, incl. abstract concepts

Brief history of DataViz

The screenshot shows the BBC Ideas website interface. At the top, there is a navigation bar with the BBC logo, a 'Sign in' button, and a menu of categories: Home, News, Sport, Reel, Worklife, Travel, Future, and Culture. A search bar is also present. Below the navigation, the 'IDEAS' logo is displayed in orange. The main content area features a video player with a large, colorful bar chart visualization. The chart consists of vertical bars of varying heights and colors, transitioning from blue on the left to red on the right. Three small human figures are shown at the bottom of the chart for scale. To the right of the video player, the video title 'Five charts that changed the world' is displayed in orange. Below the title, the video duration '5:57' and view count '25.7K VIEWS' are shown. A description follows: 'Data visualisation helps us to understand the world. It also has the power to change it. Narrated by Adam Rutherford.' The video is dated 'Animated by Adam Proctor, 22 March 2023'. At the bottom of the video player, there are several interactive elements: 'Open Transcript', 'Share', 'Like (17)', and 'Add to saved videos'. A partnership logo for 'the Royal Society' is also visible.

1. DataViz: how to

Edoardo

Why DataViz?

Visualizing data helps us to comprehend huge amounts of information by compressing them into a simple, easy to understand visualization.

It helps us to find hidden patterns or see underlying problems in the data itself which might not have been obvious without a good chart.

Alberto Cairo
@AlbertoCairo

Don't trust summary statistics. Always visualize your data first robertgrantstats.co.uk/drawmydata.html

N = 157 ; X mean = 50.7333 ; X SD = 19.5661 ; Y mean = 46.495 ; Y SD = 27.2828
Pearson correlation = -0.1772

2:47 PM · Aug 15, 2016 · Twitter Web Client

Why DataViz?

We use DataViz to **understand** our data and **communicate** them to the audience.

The goal of a DataViz is to convey information in a **clear** and **concise** format.

The human brain processes information **better** and **quickly** when it is presented visually.

How to DataViz

Good DataViz:

- Correct
- Effective
- Accessible

Bad DataViz:

- Misrepresent the data
- Use inappropriate data
- Too much or too less information
- Inconsistent
- Ignore limits of human perception

How to DataViz

Before you DataViz, think:

- Purpose
visualization?
- Audience
- Medium
- Tools
- Message
- Critical approach

Why am I making this

Who am I making it for?

How will I use and share it?

What can I use to make it?

What story does it tell?

Who does it affect? Who is left out?

Choosing the right plot type

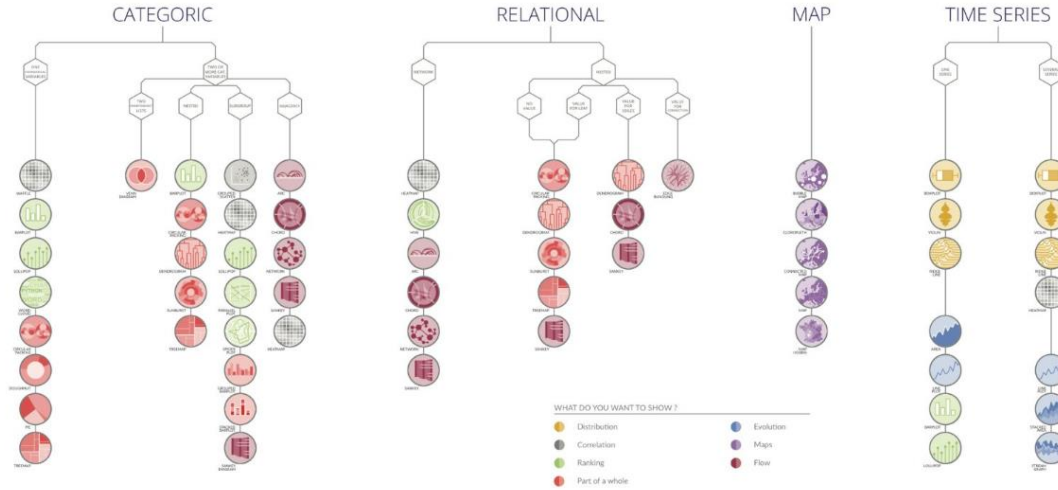

from Data
to Viz

From Data to Viz is a classification of chart types based on input data format. It will help you find the perfect chart in three simple steps.

- 1 Identify what type of data you have.
- 2 Go to the corresponding decision tree and follow it down to a set of possible charts.
- 3 Choose the chart from the set that will suit your data and your needs best.

DataViz is a world with endless possibilities and this project does not claim to be exhaustive. However it should provide you with a good starting point. For an interactive version and much more, visit:

data-to-viz.com

Graphical elements of a plot

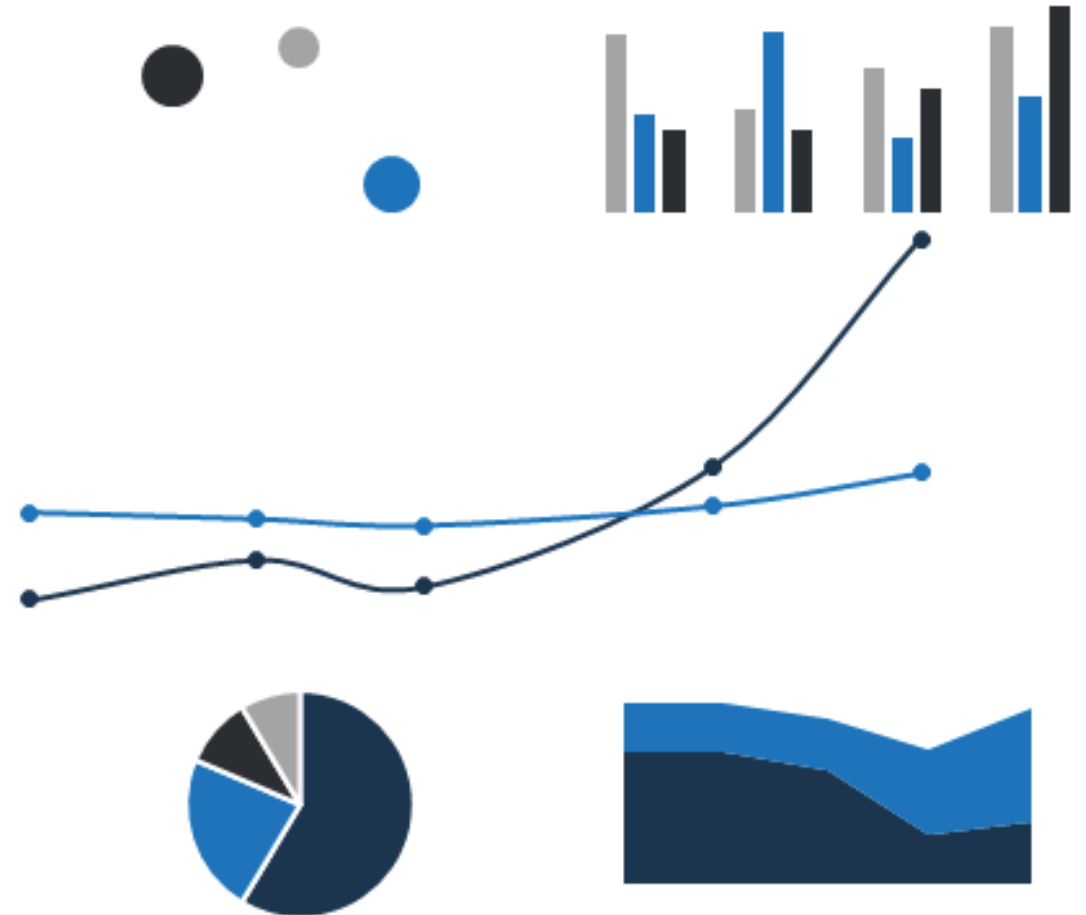

Marks and their attributes are the building blocks of all data visualizations.

Marks:

- Points
- Lines
- Areas
- Volumes

Attributes:

- Size
- Shape
- Orientation
- Colour

Graphical elements of a plot

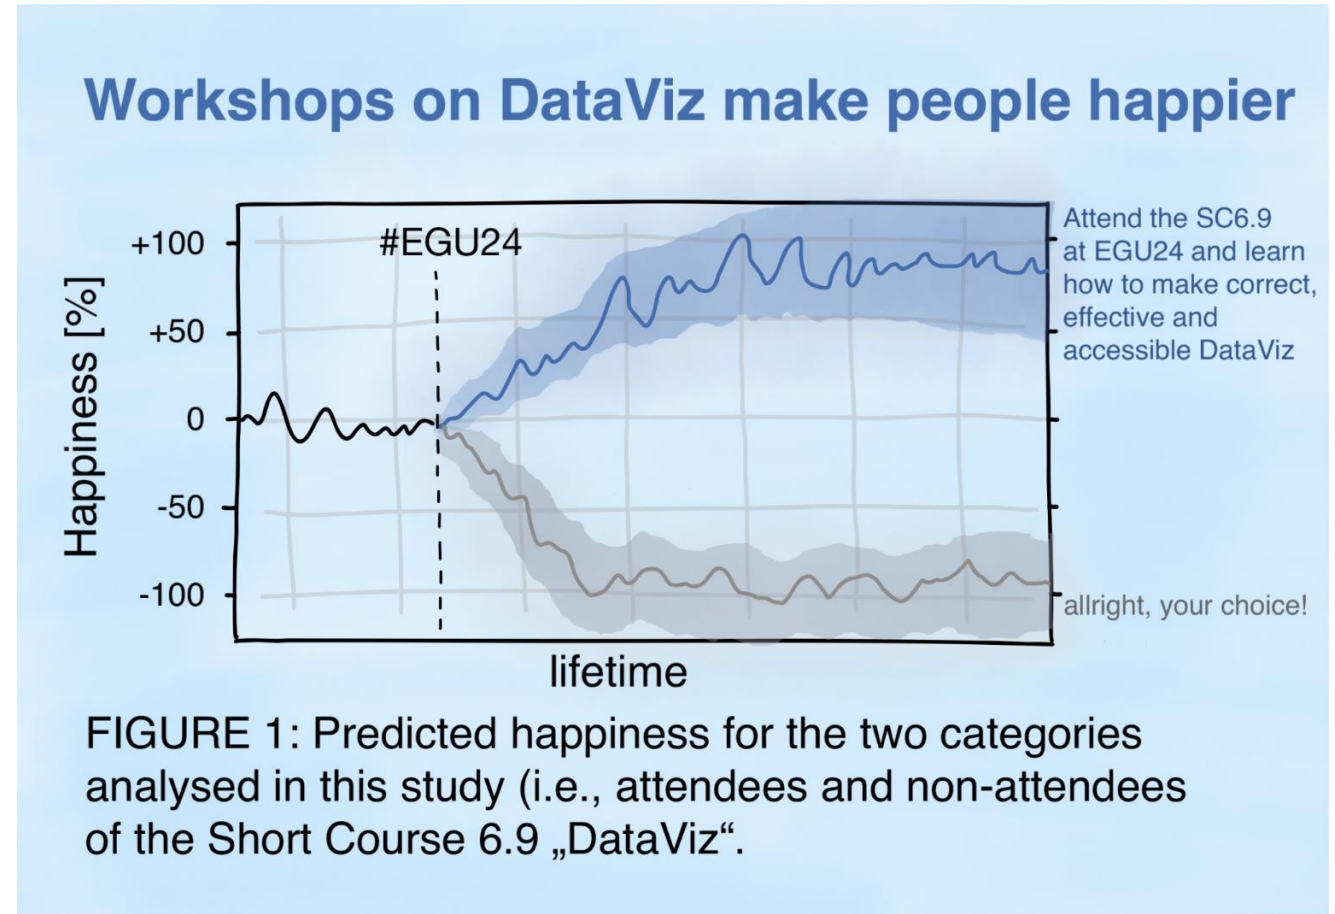

Marks and their attributes are the building blocks of all data visualizations.

Alone, they are not sufficient to convey the message

Graphical elements of a plot

- Axis
- Axis label(s)
- Axis title(s)
- Grid lines & ticks
- Title
- Caption
- Data labels
- Layout (blank spaces)

Choose the right font type

this is the “serif”

SansSerif

Sans-Serif font types are:

- more clean
- less formal
- less affected by poor resolution
- better readable?

Font size: at least 9p on paper, 18p on screen

Choose the right font type

Choose the right font type

Arial

Choose the right font type

New Roman

Choose the right font type

Georgia

Choose the right font type

Courier New

Choose the right font type

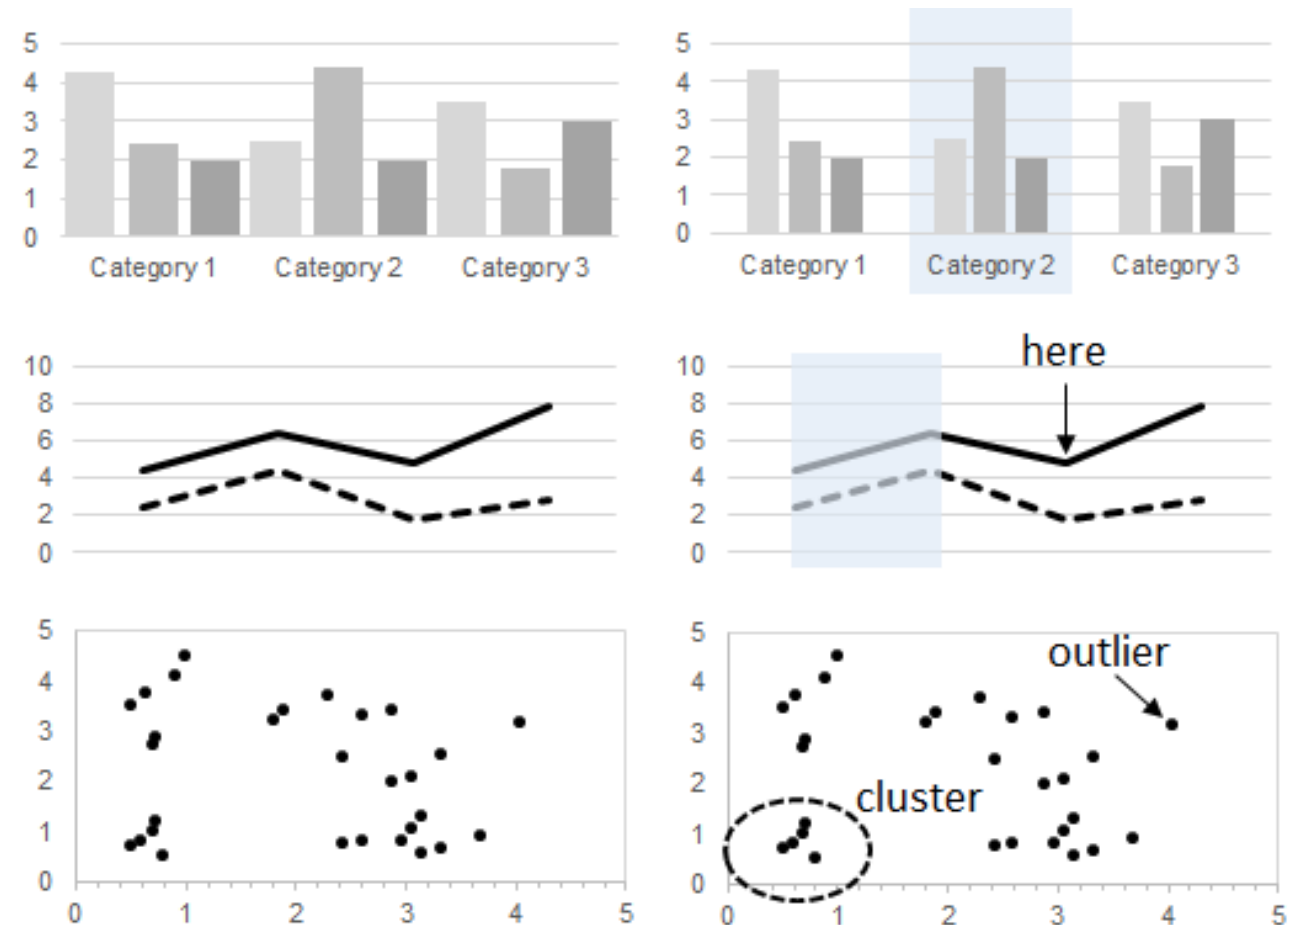

Comic

Sans

Layout (single graph)

Individual chart elements (including the spatial arrangement) work together to reinforce a unified takeaway message.

Use layout and annotation to highlight and guide the reader.

Layout (multiple graphs)

Improper arrangement of graph elements can confuse and/or mislead the readers.

Layout (multiple graphs)

Improper arrangement of graph elements can confuse and/or mislead the readers.

- Make it intuitive to the reader

Layout (multiple graphs)

Improper arrangement of graph elements can confuse and/or mislead the readers.

- Make it intuitive to the reader
- Use layout to set priorities

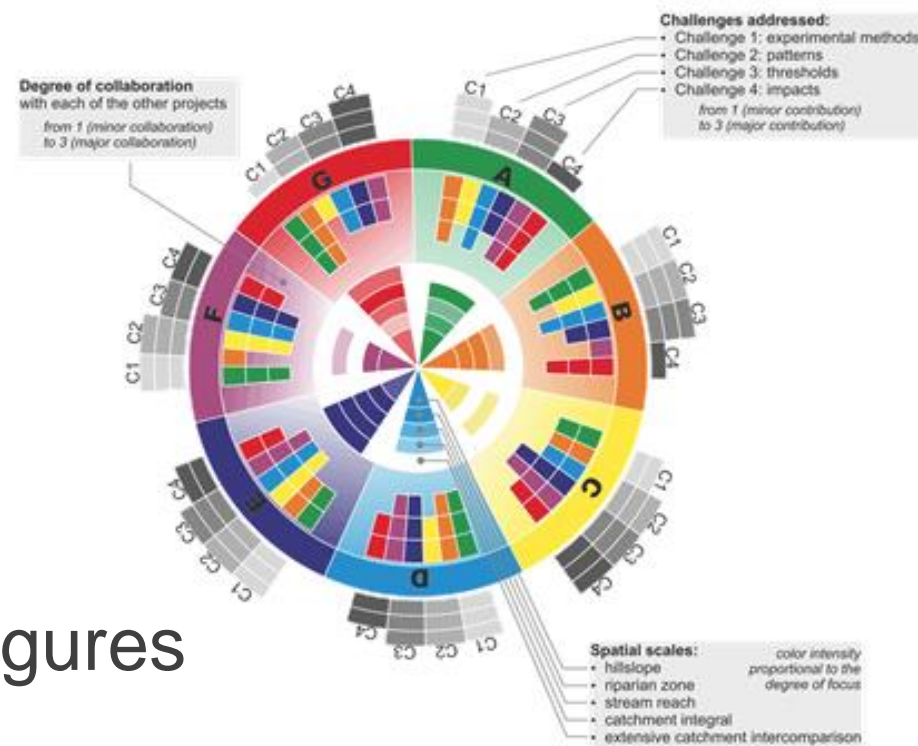

Simplicity vs creativity

Keep it simple!

- Do not overload
- Aim to one clear message vs many
- “Must have” vs “nice to have”

Or help the reader navigate the graph

- Split the content into n figures or sub-figures
- Create a hierarchy/sequence (group, highlight, annotate, ...)

Simplicity vs creativity

Beyond data plots, there are many more types of scientific visualization (posters, presentations, brochures, graphical abstracts, videos, web platforms, ...)

When we visualize scientific concepts rather than data:

- More creative approaches are accepted/recommended
- Different rules apply there

Golden rules for good DataViz

Choose colours wisely!

Choose the right font type:

Sans-Serif

The text should be readable (use different font sizes to convey a hierarchy)

Keep it **simple**, do not overload (must-have vs nice-to-have)

Choose the most appropriate **plot type**

Think before DataViz

Labels and **legend** concise and informative, avoid redundancy, when possible position the data labels near the data rather than in a separate legend

The **axes** should be clear and self-explaining

Use **layout** and **annotation** to highlight/guide

Blank spaces are your friends

Useful resources

2. Colour schemes

Paola

Colour in scientific visualization

Choose the right color scale for the right reason!

Sequential (0, 1, 2, 3...)

Gnann et al, 2019, WRR

Diverging (-2, -1, 0, 1, 2)

Ed Hawkins, Climate Stripes

Cyclic

Blöschl et al, 2017, Science

Categorical

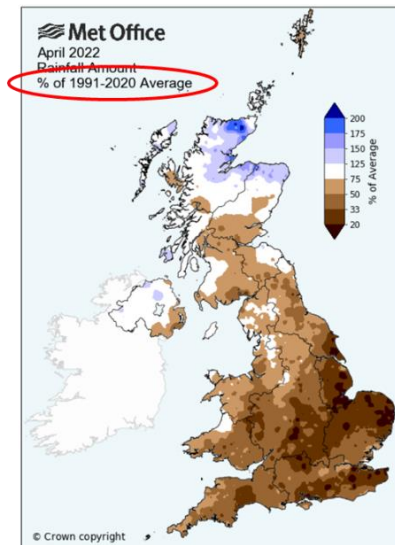

Stein et al, 2020, HP

Diverging and sequential color scale

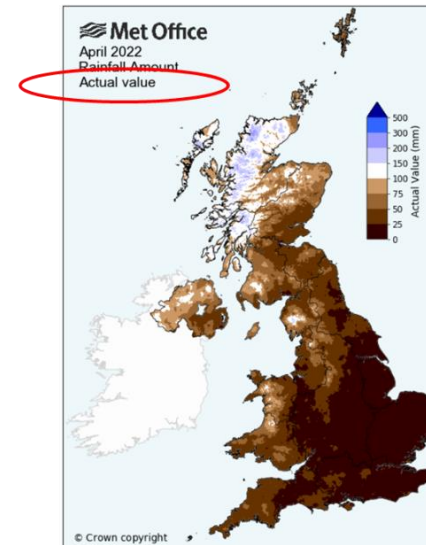

A **diverging color scale** indicates a relevant change-point.

A **sequential color scale** is needed when there is no change-point but you would like to highlight a mid-point.

Diverging values with relevant mid-point

Non-diverging values indicate a mid-point that is not there

Diverging and sequential color scale

Selecting a **sequential color scale**: Tint & Shade Generator (<https://maketintsandshades.com>)

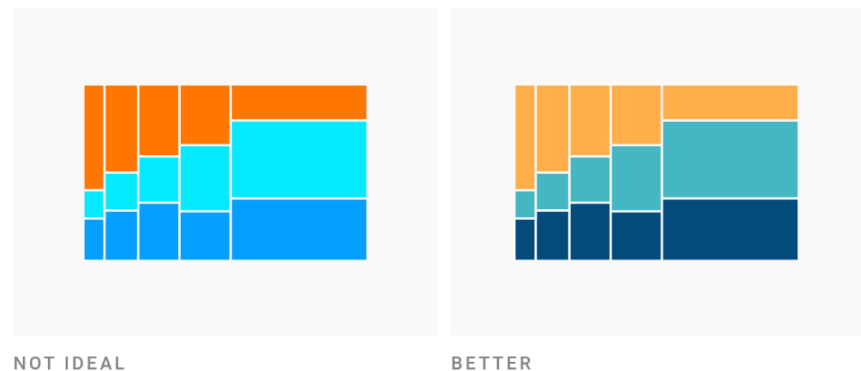

The screenshot shows the 'Tint & Shade Generator' interface. At the top, there is a pink header with the text 'Tint & Shade Generator'. Below this, a text input field contains the hex color '#eb4034'. To the right of the input field is a small preview image of a social media post with the text 'Atlantic', 'Your new development career awaits. Check out the latest listings.', and 'ADS VIA CARBON'. Below the input field is a black button with the text 'Make tints and shades' and a small icon. Underneath the button is a toggle switch labeled 'Include hashtag when copying'. At the bottom, there are two rows of color swatches. The top row shows a gradient from the original color to black, with percentage markers (0%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%) and corresponding hex codes: eb4034, d43a2f, bc332a, a52d24, 8d261f, 76201a, 5e1a15, 461310, 2f0d0a, 170605, 000000. The bottom row shows a gradient from the original color to white, with corresponding hex codes: eb4034, ed5348, ef665d, f17971, f38c85, f5a09a, f7b3ae, f9c6c2, fbd9d6, fdeceb, ffffff.

Categorical color scale

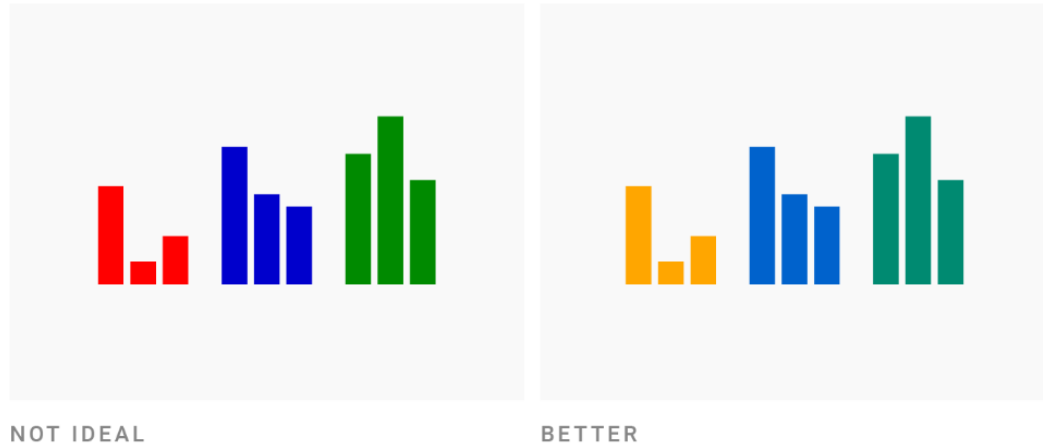

EF LEAF	EF AQUA	EF ROSE	Categorical colors for data visualizations defined by Eurofound .
RGB: 125.196.98 HEX: #7DC462 CMYK: 55.0.82.0	RGB: 13.149.208 HEX: #0D95D0 CMYK: 78.27.2.0	RGB: 231.47.82 HEX: #E72F52 CMYK: 3.95.62.0	
EF IRIS	EF GOLD	EF RUST	
RGB: 119.79.160 HEX: #774FA0 CMYK: 63.81.0.0	RGB: 239.183.67 HEX: #EFB743 CMYK: 6.29.85.0	RGB: 212.70.39 HEX: #D44627 CMYK: 11.87.100.2	

Your colors should be distinguishable at every size you'll use them in and when you print them in black and white.

Use saturation and lightness to create new and more interesting colors for your plots.

Categorical color scale

If possible, avoid pure colors: to make your colors look more natural and pleasing to your readers' eyes, you can either tone down the saturation of pure colors or make them darker.

More info on how to pick more beautiful colors for your data visualizations: <https://blog.datawrapper.de/beautifulcolors/>

Colour in scientific visualization

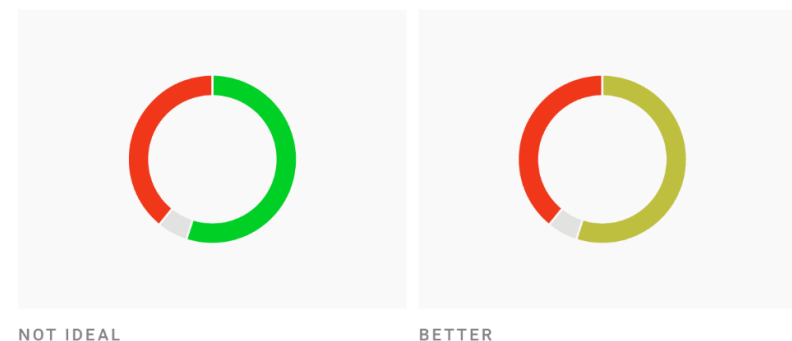

Please, check your colors!

Color combinations to avoid:

- Red - orange - brown - green (red - blue could be an option);
- Pink, turquoise and grey
- Purple and blue

Check your figures:

*In uncontested districts, including Michigan's 13th in 2018, we have imputed the most likely results

America's House of Representatives

The failure of gerrymandering

How educated, suburban whites ended the over-representation of Republicans

EVER SINCE district borders in America's House of Representatives were redrawn in 2011, Republicans' share of seats has exceeded their proportion of the vote. In 2012, Democrats won 51% of the two-party vote but just 46% of seats.

The Congress that began on January 3rd, however, has no such imbalance. Democrats won 54% of the total two-party vote—and also 54% of House seats. Whatever became of the vaunted pro-Republican bias? America's political geography is shaped

by education. In presidential contests the most influential voters are whites without college degrees, who cluster in "swing" states. By contrast, in House elections, white college graduates are unusually valuable, congregating in suburban districts where both parties are competitive.

Donald Trump has rearranged American politics, by courting working-class whites and alienating educated ones. That helped Democrats win the presidency. It should have hurt them in the House. But in 2016 the party got the best of both worlds, because many conservative whites with degrees split their tickets. In states whose presidential winner was never in doubt, that extreme gerrymandering is risky. Many Republican mapmakers tried to neutralise Democratic voters by burying them in suburban districts full of educated whites. They never imagined that this ruse would backfire, but Mr Trump drove these once-loyal Republicans into Democrats' arms.

Graphic detail Opinion on Brexit

The Economist February 23rd 2019 93

Views on Brexit have barely shifted since 2016, but leavers are split over Theresa May's deal

Remain in the EU 49%
Leave with May's deal 24%
Leave with no deal 27%

Most likely remain supporter
A 25-year-old woman with a postgraduate degree and a household income above £30,000 a year. She is very interested in politics, and voted Labour in 2015 and 2017.
94% likelihood of supporting remain

Most likely deal supporter
A 75-year-old woman with a secondary-school education and a household income below £20,000 a year. She is very interested in politics, and voted Conservative in 2015 and 2017.
58% deal 27%

Most likely no-deal supporter
A 55-year-old man who left school aged 16 and has a household income below £20,000 a year. He is very interested in politics, and voted UKIP in 2015 and Conservative in 2017.
90% likelihood of supporting no deal

Age and education strongly predict current views on remaining in the EU, but not on May's deal versus no deal

Age, years
Education
Political engagement
Sex

Sources: YouGov; The Economist. Based on 90,000 British adults surveyed November 27th to December 9th, 2018

The centre cannot hold

A polarised electorate has little desire for the government's compromise

AFTER 52% of Britons voted to leave the EU in 2016, stunned observers wondered when and how Brexit would occur. The picture is scarcely clearer today. In January Parliament rejected the withdrawal pact agreed on with the EU by Theresa May, the prime minister. Yet a majority of MPs oppose leaving without a deal. And neither Mrs May nor Jeremy Corbyn, the opposition leader, backs a second referendum, which could undo Brexit altogether.

Eventually the public will have its say on the handling of Brexit, be it in a referendum or a general election. Voters are outraged. In a recent poll, 75% of respondents said that "politicians are not up to the job". Yet voters are as split as Parliament is.

Late last year YouGov, a pollster, asked 90,000 Britons if they preferred Mrs May's accord, leaving without a deal or staying in the EU. Just as in 2016, a narrow majority of those expressing an opinion wanted to depart. Few have changed their minds: 90% of leave voters and 84% of remainers would vote the same way today. However, leavers have split over Mrs May's plan, with 24% of respondents supporting it and 27% choosing no deal. Among leavers from her own party, 55% prefer no deal to her plan.

Using YouGov's data, The Economist has built a model of the odds of each respondent backing each Brexit option. The referendum divided Britons by age, income, schooling and party: old, poor Tories with little education chose to leave, while rich young Labourites with degrees wanted to remain. Based on these variables, the model reliably identifies both no-dealers and remainers. People with the most remain-friendly profiles were 94% likely to pick remain, and those with the most anti-EU traits were 90% likely to want no deal.

In contrast, fans of Mrs May's deal have less in common with each other. The high-achiever, leaving without a deal gives to a respondent backing it is just 58%. That will make them harder to target in get-out-the-vote efforts.

Moreover, rather than sitting between no-dealers and remainers on age, income, schooling and party, deal supporters look like no-dealers, with two exceptions: interest in politics and y chromosomes. Men who follow politics closely prefer the ideological end-points of leaving with no deal or remaining. Women, especially those who mostly ignore politics, are more open to the deal. Sadly for Mrs May, peopled by politics are also unlikely to vote.

Mrs May hoped her deal would be seen as a fair compromise between EU membership and a hard Brexit. In fact, the issue is so divisive that her plan is the least popular choice. The prime minister says she opposes a new referendum out of respect for the voters' verdict in 2016. Another possibility is that she fears what would happen if the people did vote on her plan.

Graphic detail Happiness economics

The Economist March 23rd 2019 81

Self-reported happiness tends to be higher in richer countries, but does not always rise when economies grow

Happiness 0-10 scale

GDP per person self-reported happiness
85 countries with adult population over 5m

Happiness and GDP per person:
moving in the same direction
moving in opposite directions

Colour in scientific visualization

Do we even need a fixed color palette for our data visualizations?

This choice is up to you!

There are lots of good reasons to set colors in your data vis style guide. Once a good color palette is decided:

- visualizations will look **more consistent** no matter which tool you're using to create them;
- you and your team members will be able to **think less about colors while creating charts** for your works;
- consistent colors can look better than what you would choose in the three minutes before a deadline.

Colour in scientific visualization

Not having a strict color palette is an option, too.

There are good reasons for it, e.g. when it's not important that your visualizations have a strong visual identity, for whatever reason.

In this case, choose the colors following the basic principles of data viz!

3. Publication compliance

Edoardo

Rights, Permissions & Licenses

Open Access vs Subscription-Based

Creative Commons Attribution 4.0 International (CC BY 4.0)

You are free to:
